

Grapples for Forklifts

Forklift Grapple - On excavators, grapples can be used together with the crowing operation of the bucket cylinder. They are able to mount directly to the jib and can be used when handling and processing domestic and aggregate waste materials, timber and construction materials. The grapple's boxed design has additional support bridging. This manufactured design offers the grapple with utmost support and strength by preventing the body from breaking and twisting throughout its function.

Each and every moving part that encompass the grapple, including the toes, are constructed of hardened steel. The revolving points have been particularly designed to be able to guarantee supreme closing force and holding ability. The operator has the capacity to deal with different sizes and varieties of materials because of the jaws fitted at the end part of the grapple with toes. This could enable the jaws to close through one another in a finger configuration for maximum handling capacity.
